## Carry trade and negative policy rates in Switzerland

Low-lying fog or storm?

Bruno Thiago Tomio

Guillaume Vallet

23<sup>rd</sup> INFER Annual Conference

#### Motivation

- International spillovers of negative interest rate policy (NIRP) is a **very** recent strand in the literature (e.g. Arteta, Kose, Stocker and Taskin 2016<sup>1</sup>)
- Twofold interest in the Swiss franc:
  - 1. In times of turmoil, it is a major **safe haven currency**. Overall, also a **funding currency** of carry trade activities.
  - 2. Due to the "interest rate bonus" (Kugler and Weder 2002<sup>2</sup>) and the NIRP, the impacts of the Swiss National Bank's actions resonate **far** beyond Switzerland
- Lack of robust empirical papers analyzing the pervasive effects of the carry trade activity

[1] Arteta, Carlos, Ayhan Kose, Marc Stocker, and Temel Taskin. 2016. "Negative Interest Rate Policies: Sources and Implications." *Policy Research Working Paper Series* 7791. The World Bank.

[2] Kugler, Peter, and Beatrice Weder. 2002. "The Puzzle of the Swiss Interest Rate Island: Stylized Facts and a New Interpretation." *Aussenwirtschafhet* 57 (01): 49–64.

## What do we do?

In the context of the NIRP in Switzerland...

- We use data from hedge funds to investigate the behavior of the Swiss franc carry trade
  - Four major currencies: US dollar, euro, Japanese yen, and British pound
  - Disentangle the funding currency and safe haven effects
- Our Swiss franc carry trade proxy allows the investigation of different target currencies (bilateral analysis)
  - Volume approach using weekly CFTC data (non-commercial traders), based on Fong (2013)<sup>3</sup>
  - Uncovered interest rate parity (UIP), impact on asset prices, and systemic risk

[3] Fong, Wai Mun. 2013. "Footprints in the Market: Hedge Funds and the Carry Trade." *Journal of International Money and Finance* 33 (March): 41–59.

## What do we find?

Using all available data at the time (Dec 23, 2014 to Nov 24, 2020), excluding the selection bias...

- Major findings:
  - Distinctive behavior for the Swiss franc as funding and safe have currency
  - The UIP is violated for the USD, EUR and JPY models
  - Hedge funds are able to move asset prices
  - An increased systemic risk is linked to a higher Swiss franc carry trade activity

## Data and SVAR model

Table 1. Description of variables

Variable	Definition	Source
$IRD_i$	Interest rate differential using the 12-Month London Interbank Offered Rate (LIBOR) and spot (LIBOR) rates for target currencies (USD, EUR, JPY, and GBP)	FRED
VIX*	Market sentiment: CBOE DJIA Volatility Index	FRED
$CT_i$	Net position of Swiss franc-funded carry trade by target currencies, following Fong (2013)	CFTC
SM*	Domestic stock market: Swiss Market Index ^SSMI	BIS
$ER_i^*$	Nominal exchange rates (cross rates): USD/CHF, EUR/CHF, CHF/JPY, GBP/CHF	Yahoo Finance
$FSM_i^*$	Foreign stock markets: USD - S&P 500 (^GSPC), EUR - EURONEXT 100 (^N100), JPY - Nikkei 225 (^N225), GBP - FTSE 100 (^FTSE)	Yahoo Finance

<sup>\*</sup> In logarithmic form.

Table 1. Description of variables

Variable	Definition	Source
$IRD_i$	Interest rate differential using the 12-Month London Interbank Offered Rate (LIBOR) and spot (LIBOR) rates for target currencies (USD, EUR, JPY, and GBP)	FRED
VIX*	Market sentiment: CBOE DJIA Volatility Index	FRED
$CT_i$	Net position of Swiss franc-funded carry trade by target currencies, following Fong (2013)	CFTC
SM*	Domestic stock market: Swiss Market Index ^SSMI	BIS
$ER_i^*$	Nominal exchange rates (cross rates): USD/CHF, EUR/CHF, CHF/JPY, GBP/CHF	Yahoo Finance
$FSM_i^*$	Foreign stock markets: USD - S&P 500 (^GSPC), EUR - EURONEXT 100 (^N100), JPY - Nikkei 225 (^N225), GBP - FTSE 100 (^FTSE)	Yahoo Finance

<sup>\*</sup> In logarithmic form.

• Yahoo Finance data was obtained and checked/cleaned with **Q** packages quantmod and BatchGetSymbols. Overall, the problem with this source is related to individual stocks, **not indices**.

#### **CFTC** data

- Some caveats:
  - I. Bias in the classification of the traders
  - II. Trades identified as speculative may not result from carry trades
  - III. Only a small proportion of foreign exchange market activity is executed through exchanges (mostly OTC)
  - --- Galati, Heath and McGuire (2007)<sup>3</sup>
- As mentioned by market participants, CFTC data tends to be indicative of the trend of carry trade activity (Bank for International Settlements 2015)<sup>4</sup>.

[3] Galati, G., A. Heath and P. McGuire (2007), 'Evidence of carry trade activity', *BIS Quarterly Review*. [4] Bank for International Settlements (2015), *Currency Carry Trades in Latin America*, Bank for International Settlements.

- Structural vector-autoregressive (SVAR) model with Cholesky identification
  - $\circ$  Ordering:  $IRD_i \to VIX \to CT_i \to ER_i \to FSM_i \to SM$

- Structural vector-autoregressive (SVAR) model with Cholesky identification
  - Ordering:  $IRD_i \rightarrow VIX \rightarrow CT_i \rightarrow ER_i \rightarrow FSM_i \rightarrow SM$
- Toda-Yamamoto approach to capture long-term effects (non-stationary variables stay in levels)

Table 2. Exogenous variables for each model

Model	VAR lag length (p)	Exogenous variables
USD	2	$VIX_{t-3}$ , $CT_{USD,t-3}$ , $ER_{USD,t-3}$ , $FSM_{USD,t-3}$ , $SM_{t-3}$
EUR	2	$VIX_{t-3}$ , $CT_{EUR,t-3}$ , $ER_{EUR,t-4}$ , $FSM_{EUR,t-3}$ , $SM_{t-3}$
JPY	1	$VIX_{t-2}$ , $CT_{JPY,t-2}$ , $ER_{JPY,t-2}$ , $FSM_{JPY,t-2}$ , $SM_{t-2}$
GBP	1	$VIX_{t-2}$ , $CT_{GBP,t-2}$ , $SM_{t-2}$

- Structural vector-autoregressive (SVAR) model with Cholesky identification
  - $\circ$  Ordering:  $IRD_i \to VIX \to CT_i \to ER_i \to FSM_i \to SM$
- Toda-Yamamoto approach to capture long-term effects (non-stationary variables stay in levels)

Table 2. Exogenous variables for each model

Model	VAR lag length (p)	Exogenous variables
USD	2	$VIX_{t-3}$ , $CT_{USD,t-3}$ , $ER_{USD,t-3}$ , $FSM_{USD,t-3}$ , $SM_{t-3}$
EUR	2	$VIX_{t-3}$ , $CT_{EUR,t-3}$ , $ER_{EUR,t-4}$ , $FSM_{EUR,t-3}$ , $SM_{t-3}$
JPY	1	$VIX_{t-2}$ , $CT_{JPY,t-2}$ , $ER_{JPY,t-2}$ , $FSM_{JPY,t-2}$ , $SM_{t-2}$
GBP	1	$VIX_{t-2}$ , $CT_{GBP,t-2}$ , $SM_{t-2}$

• Selection of the VAR lag length follows a **step-wise approach**: unit-root tests and Lagrange-multiplier (LM) test for residual autocorrelation

- Structural vector-autoregressive (SVAR) model with Cholesky identification
  - $\circ$  Ordering:  $IRD_i \to VIX \to CT_i \to ER_i \to FSM_i \to SM$
- Toda-Yamamoto approach to capture long-term effects (non-stationary variables stay in levels)

Table 2. Exogenous variables for each model

Model	VAR lag length (p)	Exogenous variables
USD	2	$VIX_{t-3}$ , $CT_{USD,t-3}$ , $ER_{USD,t-3}$ , $FSM_{USD,t-3}$ , $SM_{t-3}$
EUR	2	$VIX_{t-3}$ , $CT_{EUR,t-3}$ , $ER_{EUR,t-4}$ , $FSM_{EUR,t-3}$ , $SM_{t-3}$
JPY	1	$VIX_{t-2}$ , $CT_{JPY,t-2}$ , $ER_{JPY,t-2}$ , $FSM_{JPY,t-2}$ , $SM_{t-2}$
GBP	1	$VIX_{t-2}$ , $CT_{GBP,t-2}$ , $SM_{t-2}$

- Selection of the VAR lag length follows a **step-wise approach**: unit-root tests and Lagrange-multiplier (LM) test for residual autocorrelation
  - Robustness checks: (1) different ordering, based on Granger causality tests, (2) non-stationary model, (3) model with time dummies, and (4) model excluding the carry trade proxy

## Results for the Impulse Response Functions (IRFs)

#### Swiss franc carry trade activity is impacted... USD EUR GBP differential $(IRD_i)$ 0.2 0.4 -Interest rate 0.3 -0.1 0.2 -0.2 Market sentiment 0.3 0.3 0.2 (XIX)0.2 -0.4 -0.3 Exchange rate 0.4 -0.3 -0.2 $(ER_i)$ 0.2 0.1 -0.2 0.1 -0.3 Foreign stock ind. market (FSM;) -0.0 - 0 0.6 0.1 -0.4 --0.1 -0.2 15 Swiss stock ind. market (SM)-0.2-0.2 -0.4 -0.3 -0.2 -0.6 15

# Results for the Granger causality tests using the Toda-Yamamoto approach

#### Swiss franc carry trade activity is Granger-caused by...

	$CT_{USD}$	$CT_{EUR}$	$CT_{JPY}$	$CT_{GBP}$
$IRD_i$	0.0483**	0.7511	0.9286	0.0558*
VIX	0.9823	0.2604	0.4740	0.5320
$ER_i$	0.0015***	0.1818	0.0241**	0.0002***
FSM	0.8945	0.3664	0.1994	0.0034***
SM	0.9624	0.3845	0.0787*	0.2506
All variables	0.0311**	0.5404	0.3112	0.0097***

#### Swiss franc carry trade activity Granger-causes...

	$IRD_i$	VIX	$ER_i$	$FSM_i$	SM
$CT_{USD}$	0.1881	0.0217**	0.3625	0.0656*	0.0442**
$CT_{EUR}$	0.0810*	0.0600*	0.0648*	0.0281**	0.0169**
$CT_{JPY}$	0.5202	0.0395**	0.7120	0.0017***	0.0255**
$CT_{GBP}$	0.8517	0.0300**	0.1296	0.0931*	0.0442**

Both tables show the p-value of the test for the absence of Granger causality. Null hypothesis is that one variable does not Granger-cause the other variable.

\*\*\*, \*\*, and \* denote statistical significance at 1%, 5%, and 10%, respectively.

## Concluding remarks

• The paper extends the carry trade literature by investigating empirically the effects of the Swiss NIRP

- The paper extends the carry trade literature by investigating empirically the effects of the Swiss NIRP
- Swiss franc carry trade is explored with four target currencies (\$, €, ¥, £)

- The paper extends the carry trade literature by investigating empirically the effects of the Swiss NIRP
- Swiss franc carry trade is explored with four target currencies (\$, €, ¥, £)
- Funding currency
  - CHF depreciation increases CT (all models but GBP)
  - Higher FSM impacts positively CT (EUR)
  - UIP failure, where CT impacts ER (USD, EUR and JPY)
  - Higher CT appreciates the CHF (USD and EUR)

- The paper extends the carry trade literature by investigating empirically the effects of the Swiss NIRP
- Swiss franc carry trade is explored with four target currencies (\$, €, ¥, £)
- Funding currency
  - CHF depreciation increases CT (all models but GBP)
  - Higher FSM impacts positively CT (EUR)
  - UIP failure, where CT impacts ER (USD, EUR and JPY)
  - Higher CT appreciates the CHF (USD and EUR)
- Safe haven currency
  - Higher FSM impacts negatively CT (USD)
  - Higher SM impacts negatively CT (JPY and GBP)
  - Higher CT depreciates the CHF (JPY)
  - Higher CT increases VIX (all models)

- The paper extends the carry trade literature by investigating empirically the effects of the Swiss NIRP
- Swiss franc carry trade is explored with four target currencies (\$, €, ¥, £)
- Funding currency
  - CHF depreciation increases CT (all models but GBP)
  - Higher FSM impacts positively CT (EUR)
  - UIP failure, where CT impacts ER (USD, EUR and JPY)
  - Higher CT appreciates the CHF (USD and EUR)
- Safe haven currency
  - Higher FSM impacts negatively CT (USD)
  - Higher SM impacts negatively CT (JPY and GBP)
  - Higher CT depreciates the CHF (JPY)
  - Higher CT increases VIX (all models)
- Additionally, for all models, there is also evidence that CT increases systemic risk (higher CT increases VIX) and moves asset prices (higher CT increases FSM and SM)

## Thank you!
